A Message from Program Chairs

It is a pleasure to welcome you to the 17th Asia Pacific International Conference on Information Science and Technology (APIC-IST 2022). The APIC-IST 2022 will be held at Gangneung, Korea on June 19-21. The APIC-IST, hosted by Korean Society for Internet Information (KSII) is the premier conference in the Asia Pacific region. The hosting organization (KSII) is the largest Internet academic society in Korea. Over the past 17 years, APIC-IST has grown to be the major international conference in Information Science and Technology area. APIC-IST continues the endeavor of high-quality, broad international participation in all areas of Information Science and Technology.

Although it is a difficult time to visit abroad due to the COVID-19, we decided to hold APIC-IST 2022 for continuing academic exchange between ICT related scholars using ICT technology such as online presentation. It aims to provide a high-quality forum for researchers and practitioners to share research findings, practices and ideas on key issues in Internet related technologies, services, and administrations. The APIC-IST 2022 Program Committee organizes as a set of thirteen(16) tracks and welcomes presentations of completed research papers as well as research-in-progress papers, panel discussion, and posters covering those issues.

The successful organization of APIC-IST has required the talents, dedication and time of many volunteers from USA, Norway, Vietnam, Pakistan, Malaysia, Saudi Arabia and Republic of Korea. Special gratitude and appreciation go to Dr. Myung-Mook Han, Dr. Mingoo Kang and various session chairs. We would also like to thank the various session chairs as they are primarily responsible for the content of the technical program.

All submitted papers went through a fair paper review process and excellent 118 papers will be presented at APIC-IST 2022. We would like to thank to all the authors and speakers for submitting and presenting their valuable research papers at APIC-IST 2022.

Keynote Speakers

Keynote Speaker Dr. Thomas Coughlin

President, Coughlin Associates, Inc., San Jose, Calif., USA

Title: The Memory of Artificial Intelligence

Abstract of the talk:

The use of various types of artificial intelligence (AI) is increasing in the data center, in factories, at the network edge and even in endpoint devices, such as smart watches. AI training and inference requires processing a lot of digital data. Traditional von Neumann computer architectures consume a lot of energy moving data around. This talk will look at processing closer to memory (including persistent memory such as MRAM, RRAM and FRAM) and storage from the data center to endpoint devices. This processing will require new computer architectures using UCIe, CXL, OMI and NVMe-oF that enable processing closer to where the data lives. These new architectures will soon dominate many computing tasks.

Title: Sensors and Machine Learning for Assisted Living

Abstract of the talk:

Worldwide, the total amount of people is growing day by day. As the elderly population with age 60 years or more is increasing quite faster than youth with age 10-24 years, there will be fewer people to take care of the elderly in the future. Hence, there should be the necessity of assisted living technologies to take care of people especially elderly or disabled, to help them living independent daily life. User care at home is a matter of great concern since unforeseen circumstances might occur that affect people's well-being. Technologies that assist people in independent living are essential for enhancing care in a cost-effective and reliable manner. Assisted care applications often demand real-time observation of the environment and the resident's activities using an event-driven system. As an emerging area of research and development, it is necessary to explore the approaches of the user care at assisted living systems to identify current practices for future research directions. This keynote presentation is aimed at a discussion of data sources (e.g., sensors) with machine learning for various smart user care approaches for assisting living technologies. Different types of data sources such as motion, video (i.e., RGB, depth, and thermal), sound, and wearables will be discussed in association with machine learning (e.g., deep learning and XAI) algorithms. Research that is related to the use of user monitoring technologies in assisted living is very widespread, but it is still consists mostly of limited-scale studies. Hence, user monitoring technology is a very promising field, especially for long-term care. However, monitoring of the users for smart assisted technologies should be taken to the next level with more detailed studies that evaluate and demonstrate their potential to contribute to prolonging the independent living of people. This presentation will discuss towards that direction.
