자료구조론 CC343_2207

Programming assignment 3

경기대학교 컴퓨터공학부 201511837 이상민

Programming Exercises

. Declare a structure that represents the following	
ierarchical information.	
(a) Student	
(b) Roll Number	

- (c) Name
 - (i) First name
 - (ii) Middle Name
 - (iii) Last Name
- (d) Sex
- (e) Date of Birth
 - (i) Day
 - (ii) Month
 - (iii) Year
- (f) Marks
 - (i) English
 - (ii) Mathematics
 - (iii) Computer Science

```
Source code:
#include <stdio.h>
struct Stdent {
        int number;
};
struct Roll_Number {
        int b;
};
struct Name {
        char Firstname[10];
        char Middlename[10];
        char Lastname[10];
};
struct sex {
        int gender;
};
struct Date_of_birth {
        int day;
        int month;
        int year;
};
struct Marks {
        int English;
        int Mathematics;
        int Computer;
};
```

2. Define a structure to store the name, an array marks[] which stores the marks of three different subjects, and a character grade. Write a program to display the details of the student whose name is entered by the user. Use the structure definition of the first question to make an array of students. Display the name of the students who have secured less than 40% of the aggregate.

이름을 저장할 구조, 세 개의 다른 과목의 마크를 저장하는 배열 표시[] 및 문자 등급을 정의한다. 사용자가 이름을 입력한 학생의 세부사항을 표시하는 프로그램을 작성한다. 첫 번째 문제의 구조 정의를 사용하여 학생 배열을 만드십시오. 골재량의 40% 미만을 확보한 학생의 이름을 표시한다.

```
Enter information of students:

For roll number1,
Enter first name: lee
Enter marks: 40

For roll number2,
Enter first name: kim
Enter marks: 80

For roll number3,
Enter first name: koi
Enter marks: 30

For roll number4,
Enter first name: jio
Enter marks: 20

For roll number5,
Enter first name: ijo
Enter marks: 90
Displaying Information:

Roll number: 3
First name: koi
Marks: 30.0

Roll number: 4
First name: jio
Marks: 20.0
```

```
#define _CRT_SECURE_NO_WARNINGS
#include <stdio.h>
#include <stdio.h>
struct student {
        char firstName[50];
        int roll;
        float marks;
```

```
} s[10];
int main() {
         int i;
         printf("Enter information of students:₩n");
         // storing information
         for (i = 0; i < 5; ++i) {
                   s[i].roll = i + 1;
                   printf("₩nFor roll number%d,₩n", s[i].roll);
                   printf("Enter first name: ");
                   scanf("%s", s[i].firstName);
                   printf("Enter marks: ");
                   scanf("%f", &s[i].marks);
         }
         printf("Displaying Information:₩n₩n");
         // displaying information
                   for (i = 0; i < 5; ++i) {
                             if (s[i].marks < 40) {
                                      printf("\forallnRoll number: %d\foralln", i + 1);
                                      printf("First name: ");
                                      puts(s[i].firstName);
                                      printf("Marks: %.1f", s[i].marks);
                                      printf("₩n");
                            }
                   }
         return 0;
```

}

3. Modify Question 2 to print each student's average marks and the class average (that includes average of all the student's marks).

질문 2를 수정하여 각 학생의 평균 점수와 학급 평균(모든 학생 점수의 평균 포함)을 인쇄하십시오.

```
Enter information of students:

For roll number1,
Enter first name: lee
Enter marks: 40

For roll number2,
Enter first name: kim
Enter marks: 80

For roll number3,
Enter first name: koi
Enter marks: 30

For roll number4,
Enter first name: jio
Enter marks: 20

For roll number5,
Enter first name: ijo
Enter marks: 90
Displaying Information:

Roll number: 3
First name: koi
Marks: 30.0

Roll number: 4
First name: jio
Marks: 20.0
average 52
a
```

```
#define _CRT_SECURE_NO_WARNINGS
#include <stdio.h>
#include <stdio.h>
struct student {
         char firstName[50];
         int roll;
         float marks;
} s[10];
int main() {
         int i;
```

```
int sum = 0;
printf("Enter information of students:₩n");
// storing information
for (i = 0; i < 5; ++i) {
         s[i].roll = i + 1;
         printf("₩nFor roll number%d,₩n", s[i].roll);
         printf("Enter first name: ");
         scanf("%s", s[i].firstName);
         printf("Enter marks: ");
         scanf("%f", &s[i].marks);
}
printf("Displaying Information:₩n₩n");
// displaying information
         for (i = 0; i < 5; ++i) {
                  if (s[i].marks < 40) {
                            printf("₩nRoll number: %d₩n", i + 1);
                            printf("First name: ");
                            puts(s[i].firstName);
                            printf("Marks: %.1f", s[i].marks);
                            printf("₩n");
                  }
                  sum = sum + s[i].marks;
         }
         printf("average %d", sum / 5);
return 0;
```

}

4. Make an array of students as illustrated in Question 1 and write a program to display the details of the student with the given Date of Birth.

문제 1에 설명된 대로 학생 배열을 만들고 주어진 생년월일로 학생의 세부사항을 표시하는 프로 그램을 작성한다.

```
#define _CRT_SECURE_NO_WARNINGS
#include <stdio.h>
struct Stdent {
        int number;
};
struct Roll_Number {
        int b;
};
struct Name {
        char Firstname[10];
        char Middlename[10];
        char Lastname[10];
};
struct sex {
        int gender;
```

```
};
typedef struct Date_of_birth {
        int day;
        int month;
        int year;
}date;
struct Marks {
        int English;
        int Mathematics;
        int Computer;
};
int main() {
        date d;
        printf("생일년도₩n");
        scanf("%d", &d.day);
        printf("생일 월₩n");
        scanf("%d", &d.month);
        printf("생일 요일₩n");
        scanf("%d", &d.year);
        printf("%d %d %d", d.day, d.month, d.year);
};
```

5. Write a program to find smallest of three numbers using structures. 구조를 사용하여 세 숫자 중 가장 작은 숫자를 찾는 프로그램을 작성한다.

```
Enter three number 10 20 30
Smallest number is: 10
C:\Users\이상민\source\repos\P

         if (y.year % 4 == 0) {
                   if (y.year \% 100 == 0) {
                            if (y.year \% 400 == 0)
                                      printf("%d is a leap year.", y.year);
                            else
                                      printf("%d is not a leap year.", y.year);
                   }
                   else
                            printf("%d is a leap year.", y.year);
         }
         else
                   printf("%d is not a leap year.", y.year);
         return 0;
}
```

11. Write a program using pointer to structure to initialize the members of an employee structure. Use functions to print the employee's information.

직원 구조의 구성원을 초기화하기 위해 포인터를 사용하여 프로그램을 작성한다. 기능을 사용하여 직원의 정보를 인쇄하십시오.

}

```
#define _CRT_SECURE_NO_WARNINGS
#include <stdio.h>
struct employee
{
        int age;
        float weight;
};
int main()
{
        struct employee *employeePtr, employee1;
        employeePtr = &employee1;
        printf("Enter age: ");
        scanf("%d", &employeePtr->age);
        printf("Enter weight: ");
        scanf("%f", &employeePtr->weight);
        printf("Displaying:₩n");
        printf("Age: %d₩n", employeePtr->age);
        printf("weight: %f", employeePtr->weight);
        return 0;
```

12. Write a program to create a structure with the information given below. Then, read and print the data.
아래와 같은 정보로 구조를 만드는 프로그램을 작성한다. 그런 다음 데이터를 읽고 인쇄하십시오.
Employee[10]

(a) Emp_ld
(b) Name

(i) First Name

(ii) Middle Name

(iii) Last Name

(c) Address

(i) Area

(ii) City

(iii) State

(d) Age

(e) Salary

#include <stdio.h>

struct employee{

int age;

struct name {

};

int emp_id;

double salary;

int designation;

(f) Designation

#define _CRT_SECURE_NO_WARNINGS

```
char FirstName[10];
  char MiddleName[10];
  char LastName[10];
};
struct Address {
  char Area[10];
  char City[10];
  char State[10];
};
```

13. Define a structure date containing three integers— day, month, and year. Write a program using functions to read data, to validate the date entered by the user and then print the date on the screen. For example, if you enter 29,2,2010 then that is an invalid date as 2010 is not a leap year. Similarly 31,6,2007 is invalid as June does not have 31 days.

일, 월, 년 등 세 개의 정수를 포함하는 구조 날짜를 정의한다. 사용자가 입력한 날짜를 확인하고 화면에 날짜를 인쇄하기 위해 기능을 사용하여 프로그램을 작성한다. 예를 들어, 29,2,2010을 입력 하면 2010년은 윤년이 아니므로 그 날짜는 유효하지 않다. 마찬가지로 6월에도 31일이 없기 때문 에 31,6,2007년은 무효다.

```
Enter year month day: 2010 2 29
Date is invalid.2010 2 29 is not a leap year.

                  if (gr == ht[i].grade)
                            printf("%s / %s / %s / %d / %d ₩n", ht[i].name, ht[i].city, ht[i].grade, ht[i].rc,
ht[i].nr);
         printf("enter a room charge to print hotels less than given charge n:");
         scanf("%d", &c);
```

printf("enter name of city n : ");

```
printf("\forall n"); printf("hotel name / city / grade / roomcharge no of rooms \forall n"); for (i = 0; i < n; i++) if (c >= ht[i].rc) printf("\%s / \%s / \%s / \%d / \%d /", ht[i].name, ht[i].city, ht[i].grade, ht[i].rc, ht[i].nr); }
```

18. Write a program to define a union and a structure both having exactly the same members. Using the size of operator, print the size of structure variable as well as union variable and comment on the result.

조합과 조합을 정의하는 프로그램을 작성하라. 측정 시스템의 크기를 사용하여 구조 변수의 크기 및 조합 변수를 인쇄하고 결과에 대해 설명하십시오.

```
Memory size occupied by union data :
Memory size occupied by structure data : 28
C:₩Users₩이상민₩source₩repos₩Project1₩Debug₩Projec
#include <stdio.h>
union uData {
         int i;
         float f;
         char str[20];
};
struct sData {
         int i;
         float f;
         char str[20];
};
int main() {
         union uData uData;
         struct sData sData;
         printf("Memory size occupied by union data: %d ₩n", sizeof(uData));
         printf("Memory size occupied by structure data: %d", sizeof(sData));
         return 0;
}
```

19. Declare a structure time that has three fields—hr, min, sec. Create two variables start_time and end_time. Input their values from the user. Then while start_time does not reach the end_time, display GOOD DAY on the screen.

3개의 필드(hr, min, sec)가 있는 구조 시간을 선언한다. start_time 및 end_time 변수 두 개를 생성하십시오. 사용자로부터 값을 입력하십시오. 그런 다음 start_time이 end_time에 도달하지 않는 동안 화면에 GOOD DAY를 표시하십시오.

```
-Enter START TIME-
      Enter END TIME-
#define _CRT_SECURE_NO_WARNINGS
#include <stdio.h>
typedef struct time {
        char hour[10];
        char min[10];
        char sec[10];
}time;
int main() {
        time t;
        printf("-----Enter START TIME-----₩n");
        scanf("%s %s %s", &t.hour[0], &t.min[0], &t.sec[0]);
        printf("-----Enter END TIME-----₩n");
        scanf("%s %s %s", &t.hour[1], &t.min[1], &t.sec[1]);
        if (t.hour[0] == t.hour[1] && t.min[0] == t.min[1] && t.sec[0] == t.sec[1])
                 printf("GOOD DAY");
        else
                 printf("NO");
}
```

20. Declare a structure fraction that has two fields— numerator and denominator. Create two variables and compare them using function. Return 0 if the two fractions are equal, –1 if the first fraction is less than the second and 1 otherwise. You may convert a fraction into a floating point number for your convenience.

분자와 분모 두 개의 필드가 있는 구조 분수를 선언한다. 두 개의 변수를 만들어 함수를 사용하여 비교한다. 두 분율이 같으면 0을 반환하고, 첫 번째 분율이 두 번째 분율보다 작으면 -1을 반환하고, 그렇지 않으면 1을 반환한다. 편리를 위해 분수 값을 부동 소수점 번호로 변환할 수 있다.

```
#define _CRT_SECURE_NO_WARNINGS
#include <stdio.h>
typedef struct fraction {
        float numerator;
        float denominator;
}fraction;
int main() {
        fraction f1, f2;
        printf("분수 두개 입력 :\Hn");
        scanf("%f %f %f %f", &f1.numerator, &f1.denominator, &f2.numerator, &f2.denominator);
        if (f1.numerator / f1.denominator > f2.numerator / f2.denominator)
                 printf("1");
        else if (f1.numerator / f1.denominator == f2.numerator / f2.denominator)
                 printf("0");
        else
                 printf("-1");
}
```

21. Declare a structure POINT. Input the coordinates of a point variable and determine the quadrant in which it lies. The following table can be used to determine the quadrant 구조 POINT를 선언한다. 점 변수의 좌표를 입력하고 그것이 놓여 있는 사분면을 결정한다. 다음 표를 사용하여 사분면을 결정할 수 있다.

Quadrant	X	Y
1	Positive	Positive
2	Negative	Positive
3	Negative	Negative
4	Positive	Negative

```
#define _CRT_SECURE_NO_WARNINGS
#include <stdio.h>
typedef struct POINT {
         int x;
         int y;
}point;
int main() {
         point p;
         printf("Enter x point y point \foralln");
         scanf("%d %d", &p.x, &p.y);
         if (p.x >= 0 \&\& p.y >= 0)
                  printf("1");
         else if (p.x < 0 \&\& p.y >= 0)
                  printf("2");
         else if (p.x < 0 \&\& p.y < 0)
                  printf("3");
         else if (p.x >= 0 \&\& p.y < 0)
                  printf("4");
}
```

22. Write a program to calculate the area of one of the geometric figures—circle, rectangle or a triangle. Write a function to calculate the area. The function must receive one parameter which is a structure that contains the type of figure and the size of the components needed to calculate the area must be a part of a union. Note that a circle requires just one component, rectangle requires two components and a triangle requires the size of three components to calculate the area.

원형, 직사각형 또는 삼각형 등 기하학적 그림 중 하나의 영역을 계산하는 프로그램을 작성한다. 함수를 작성하여 면적을 계산한다. 함수는 그림의 유형과 면적 계산에 필요한 구성 요소의 크기 를 포함하는 하나의 매개변수를 수신해야 한다. 원에는 한 개의 성분만 있고, 직사각형은 두 개의 성분이 필요하며, 삼각형은 면적을 계산하기 위해 세 개의 성분 크기가 필요하다.

```
삼각형 면적을 위한 세 변수입력 : 10 20 30
'삼각형 면적 : 0.000
'원 면적을 위한 하나의 변수 입력 : 20
원 면적 : 1256.000
'직사각형 면적을 위한 두 변수입력 : 20 20
직사각형 면적 : 400.000
